Heat Pumps

Heat pumps move heat rather than producing it directly by burning fuel. One important reason is that in winter they transfer heat from outside air or the ground into a building, and many systems can reverse the process for cooling. In addition, their efficiency varies with climate, building insulation, and system design. Researchers therefore note that heat pumps can reduce direct fuel use but work best in suitable buildings. Nevertheless, older buildings may need upgrades before a heat pump can perform well. The issue is not simply whether the approach has value, but under which conditions it works best. In particular, building condition can affect how well a heat pump performs. For this reason, energy planners view heat pumps as one tool for reducing direct fossil-fuel use in buildings.
