Vertical Farming

Vertical farms grow crops in stacked indoor layers under controlled conditions. This development is often justified by the fact that they can use less land and recycle water efficiently, while producing food close to urban consumers; moreover, artificial lighting and climate control require substantial amounts of electricity. Taken together, these points suggest that vertical farming offers resource advantages but has important energy costs. Yet the apparent advantages should not be treated as automatic, because the approach is therefore more suitable for some high-value leafy crops than for large quantities of staple grains. A careful interpretation therefore requires attention to the conditions under which the method is used. In particular, vertical farming is not equally suitable for all types of crops. Consequently, researchers are working to reduce energy use and improve crop varieties for indoor systems.
